TOGETHER FIRST

A global system that works for all

Is for complete:	**Organisation name:**	**Is organisation?**
Yes	Yes	Yes
Climate collapse	**Facility or multiple risks**	**Short**
Global catastrophic risks mitigated	**Risk multipliers managed**	**Implementation timeframe**

[illegible]

[illegible] and partner organizations is an essential yet severely overlooked dimension of climate action. Bringing attention to the security implications of climate change will mobilize not just Member States but also other stakeholders (civil society, private sector, other International organizations) to better understand and act against the security implications of climate change.

This depends in part on persuading a number of key players, among them permanent seat holders at the Security Council, that the Security Mechanism has been [illegible] to be [illegible] over powers.

40 states, both rich and developing countries. Given that the Mechanism is only one year old, this expansion in the [illegible] of the Group of Friends [illegible] Security Council [illegible] of [illegible] Assembly and the Human Rights Council. Once there are some players that have been reluctant to endorse this agenda, to expand political will for Climate and Security governance requires at least three additional steps: (4) Expanding the UN Climate and Security Group of Friends, currently at 40 states, and ensuring that it includes a range of geographies, development levels and experiences with peace and security; (5) Identifying the next "climate and security" champions among candidates to the UN Security Council

Moreover, there is interest and even urgency on the part of senior UN officials from all three pillars of the architecture- development, human rights and peace and security- regarding integrating climate and security into a preventive approach.
